## 3. Equation

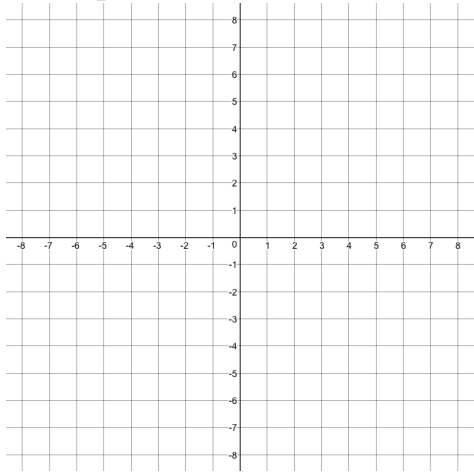

Check:

*All 3 methods represent the **SAME PATTERN!***

In Section 4.1, we used a table of values to get the graph and the equation for a pattern. Let's do one more example with  $x$  and  $y$  now.

<p><u>1. Table of Values and Ordered Pairs</u></p> <table style="margin-left: 20px; border-collapse: collapse;"> <thead> <tr> <th style="border-right: 1px solid black; border-bottom: 1px solid black; padding: 5px;"><math>x</math></th> <th style="border-bottom: 1px solid black; padding: 5px;"><math>y</math></th> <th style="padding: 5px;"><math>(x, y)</math></th> </tr> </thead> <tbody> <tr> <td style="border-right: 1px solid black; padding: 5px;">-2</td> <td style="padding: 5px;">-7</td> <td style="padding: 5px;">( , )</td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">-1</td> <td style="padding: 5px;">-4</td> <td style="padding: 5px;">( , )</td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">0</td> <td style="padding: 5px;">-1</td> <td style="padding: 5px;">( , )</td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">1</td> <td style="padding: 5px;">2</td> <td style="padding: 5px;">( , )</td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">2</td> <td style="padding: 5px;">5</td> <td style="padding: 5px;">( , )</td> </tr> </tbody> </table>	$x$	$y$	$(x, y)$	-2	-7	( , )	-1	-4	( , )	0	-1	( , )	1	2	( , )	2	5	( , )	<p><u>2. Graph</u></p> 	<p><u>3. Equation</u></p> <p style="text-align: center; margin-top: 100px;"><u>Check:</u></p>
$x$	$y$	$(x, y)$																		
-2	-7	( , )																		
-1	-4	( , )																		
0	-1	( , )																		
1	2	( , )																		
2	5	( , )																		

Remember: For a linear pattern, there are **two** important features:

1. \_\_\_\_\_
2. \_\_\_\_\_

When we talk about equations of lines (especially when we use  $x$  and  $y$ ) we use different names for the same two things:

**$y$  – intercept:** \_\_\_\_\_

which is the same as: \_\_\_\_\_

**slope:** \_\_\_\_\_

which is the same as: \_\_\_\_\_

The linear equation:  $y = 3x - 1$  has a  $y$ -intercept = \_\_\_\_\_ and a slope = \_\_\_\_\_

The linear equation:  $y = \frac{1}{2}x + \frac{4}{3}$  has a  $y$ -intercept = \_\_\_\_\_ and a slope = \_\_\_\_\_

The linear equation:  $y = x - 2$  has a  $y$ -intercept = \_\_\_\_\_ and a slope = \_\_\_\_\_

The linear equation:  $y = -x$  has a  $y$ -intercept = \_\_\_\_\_ and a slope = \_\_\_\_\_

**Example #1:** Graph the linear equation  $y = -2x + 3$

(In this example, the y-intercept = \_\_\_\_\_ and the slope = \_\_\_\_\_)

**Step 1:** Create a table of values and ordered pairs that match with the equation

**Step 2:** Plot the points on a graph and join them as a line, with arrows on both ends

*(Note: You can choose ANY values for x, then use those values to calculate y)*

<u>1. Table of Values and Ordered Pairs</u> Choose 5 different x values Calculate the y values that match. Write the ordered pairs!	<u>2. Graph</u> Plot the points and <b>join</b> them as a line. Draw arrows on both ends to show it continues in both directions forever																		
<table><thead><tr><th><u>x</u></th><th><u>y</u></th><th>(x,y)</th></tr></thead><tbody><tr><td>_____</td><td>_____</td><td>( , )</td></tr><tr><td>_____</td><td>_____</td><td>( , )</td></tr><tr><td>_____</td><td>_____</td><td>( , )</td></tr><tr><td>_____</td><td>_____</td><td>( , )</td></tr><tr><td>_____</td><td>_____</td><td>( , )</td></tr></tbody></table>	<u>x</u>	<u>y</u>	(x,y)	_____	_____	( , )	_____	_____	( , )	_____	_____	( , )	_____	_____	( , )	_____	_____	( , )	
<u>x</u>	<u>y</u>	(x,y)																	
_____	_____	( , )																	
_____	_____	( , )																	
_____	_____	( , )																	
_____	_____	( , )																	
_____	_____	( , )																	

**Example #2:**  $3y - x + 9 = 0$

(In this example, we need to convert into  $y=mx+b$  form first!)

(The y-intercept = \_\_\_\_\_ and the slope = \_\_\_\_\_)

Find 5 ordered pairs that match with the equation, then draw the graph

Convert into $y=mx+b$ form:  <table><thead><tr><th>(x,y)</th></tr></thead><tbody><tr><td>( , )</td></tr><tr><td>( , )</td></tr><tr><td>( , )</td></tr><tr><td>( , )</td></tr><tr><td>( , )</td></tr></tbody></table>	(x,y)	( , )	( , )	( , )	( , )	( , )	
(x,y)							
( , )							
( , )							
( , )							
( , )							
( , )							

*(It makes life easier if we pick multiples of 3 so that we don't have to graph fractions)*

**Example #3:** In January, the temperature ( $T$ ) outside Lord Byng is given by the equation  $T = 2h - 5$  where  $h$  is the number of hours after school starts.

In this example, we should put \_\_\_\_\_ on the  $x$ -axis and \_\_\_\_\_ on the  $y$ -axis.

The  $y$ -intercept = \_\_\_\_\_ and the slope = \_\_\_\_\_

a) Find the temperature outside Byng zero, two and four hours after school starts.

b) Graph the equation

c) **Using the graph**, estimate the temperature outside Byng 5 ½ hours after school starts.

d) **Using the graph**, estimate how many hours after school starts is the temperature 0 degrees.

**Homework:** Section 4.2 # 4-5all, 6all, 7left, 8 (a-f), 10, 12, 13
